(57) Abstract :

Title - Cloud and IoT based disease prediction and diagnosis system for healthcare using Fuzzy neural classifier Abstract Each person's need for fluid is slightly different and depends on lean muscle mass, heart health, body fat and various other factors. Each cell has a fluid-filled outer membrane inside which contains all the structures necessary for cell function. Cells form tissues, in which many channels or fluid is organized into different structures. This fluid is all water dependent and must have enough water to balance all the salts and particles in it. The Water and salt move from cell to cell, as well as into and out of the bloodstream as the body needs to balance fluids. When the body is adequately hydrated and has enough fluid to fill the bloodstream space, the systems usually function properly. Physical testing is a series of tests that, in an objective way, help us to measure or diagnose the condition. Process is a disease, condition or injury that is identified by its signs and symptoms. Tests such as a diagnosis, a health history or physical examination and blood tests, imaging tests and biopsies may be used to help. Its purpose is that assessment diagnostics is considered to be essential for the successful initiation of new learning processes as it is the acquisition of information about the initial state of subjects based on knowledge and skills.
